MealMate.

End-term defense — practical results from Weeks 6–9:

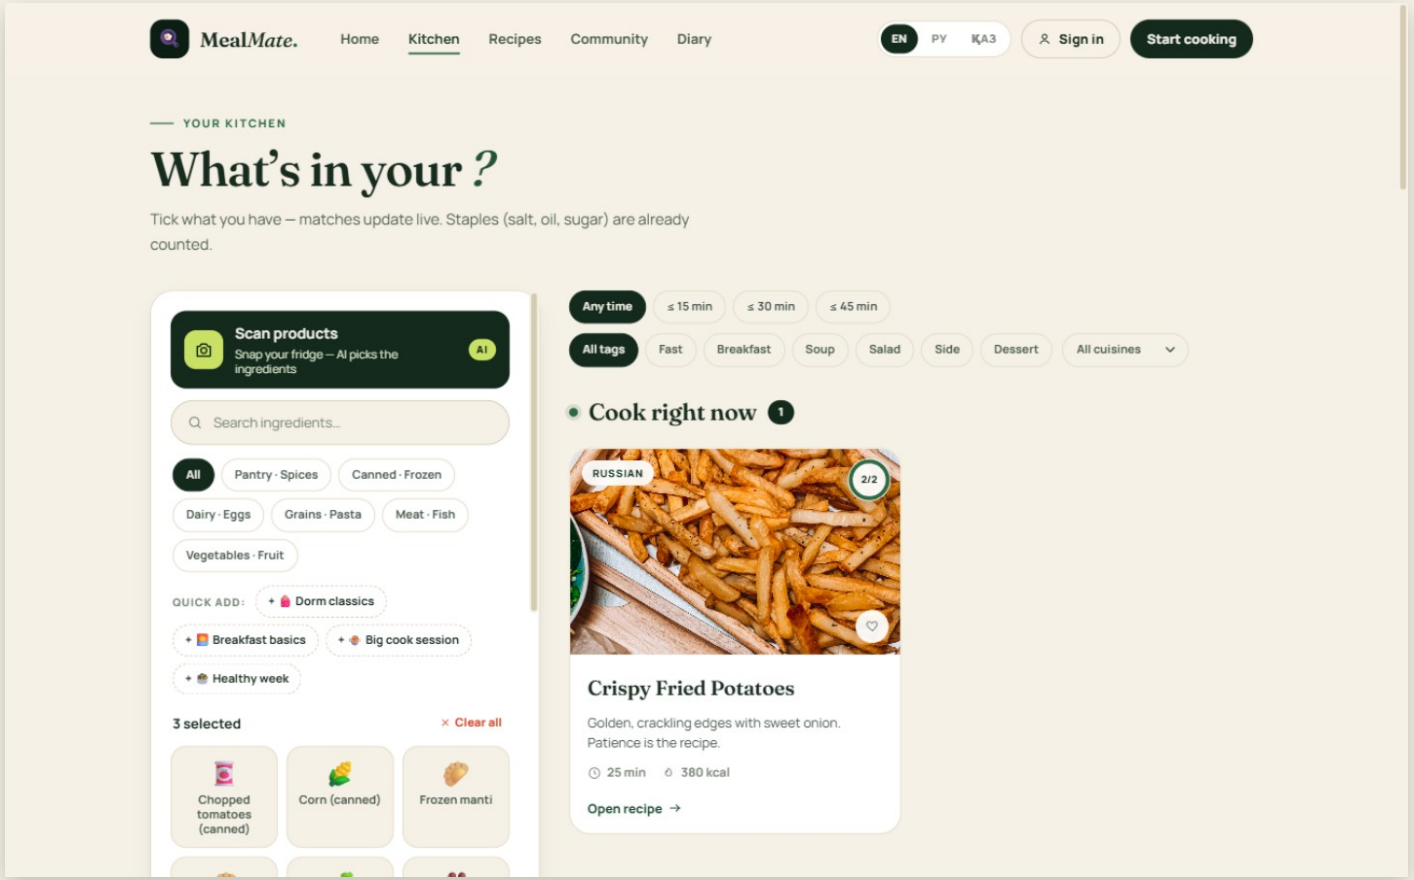

Database Systems · Cybersecurity · Multimedia Technologies

https://mealmate-29tt.onrender.com

CS-2618 · Samarin · Kaniyazov · Sadybek · Temirtas

A web app that matches recipes to the food you already own.

Live: the ingredient picker with an instant match list

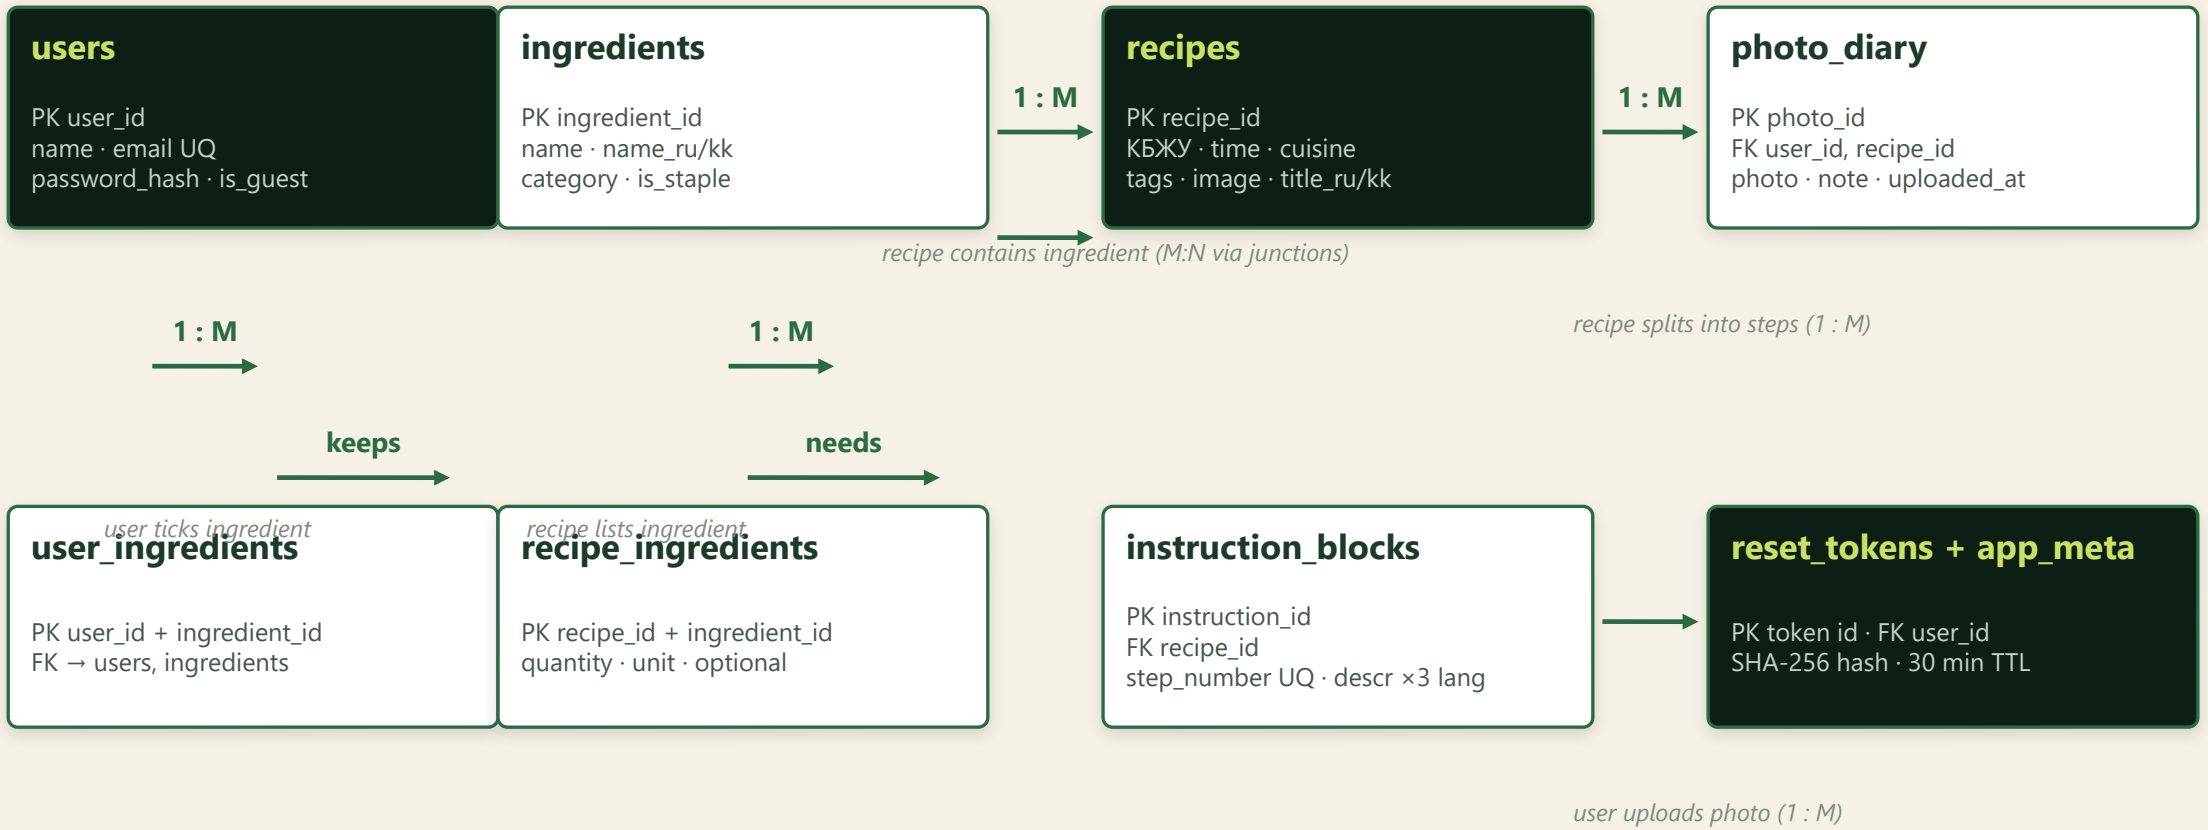

68 recipes across 5 cuisines — 14 Kazakh

51 picker ingredients, every one covered by a recipe

3 languages: EN / RU / KK — UI, content and cooking steps

Stack: React 18 → Express (Node 24) → SQLite. Deployed on Render, source on GitHub.

7 core entities, PK/FK on every table, verbs on relationships.

M:N resolved with junction tables; **editable source: docs/er-diagram.dbml → paste at dbdiagram.io during the defense.**

Business rules: unique e-mail · step numbers unique within a recipe · FK ON DELETE CASCADE.

Ready for the live challenge: change one thing, explain everything.

is_staple flag	salt, oil, sugar are assumed available — the matcher never counts them as missing. Change during defense: flip it and «Almost there» grows by hundreds of rows.
i18n columns	title_ru/kk, description_ru/kk on recipes; name_ru/kk on ingredients; localized steps. The API picks the column with ?lang= and falls back to English.
Junction extras	recipe_ingredients carries quantity, unit, optional — so the UI shows «600 g» and skips optional items when matching.
Indexes & integrity	FK ON DELETE CASCADE everywhere; indexes on junctions and diary(user_id); UNIQUE email and (recipe_id, step_number).

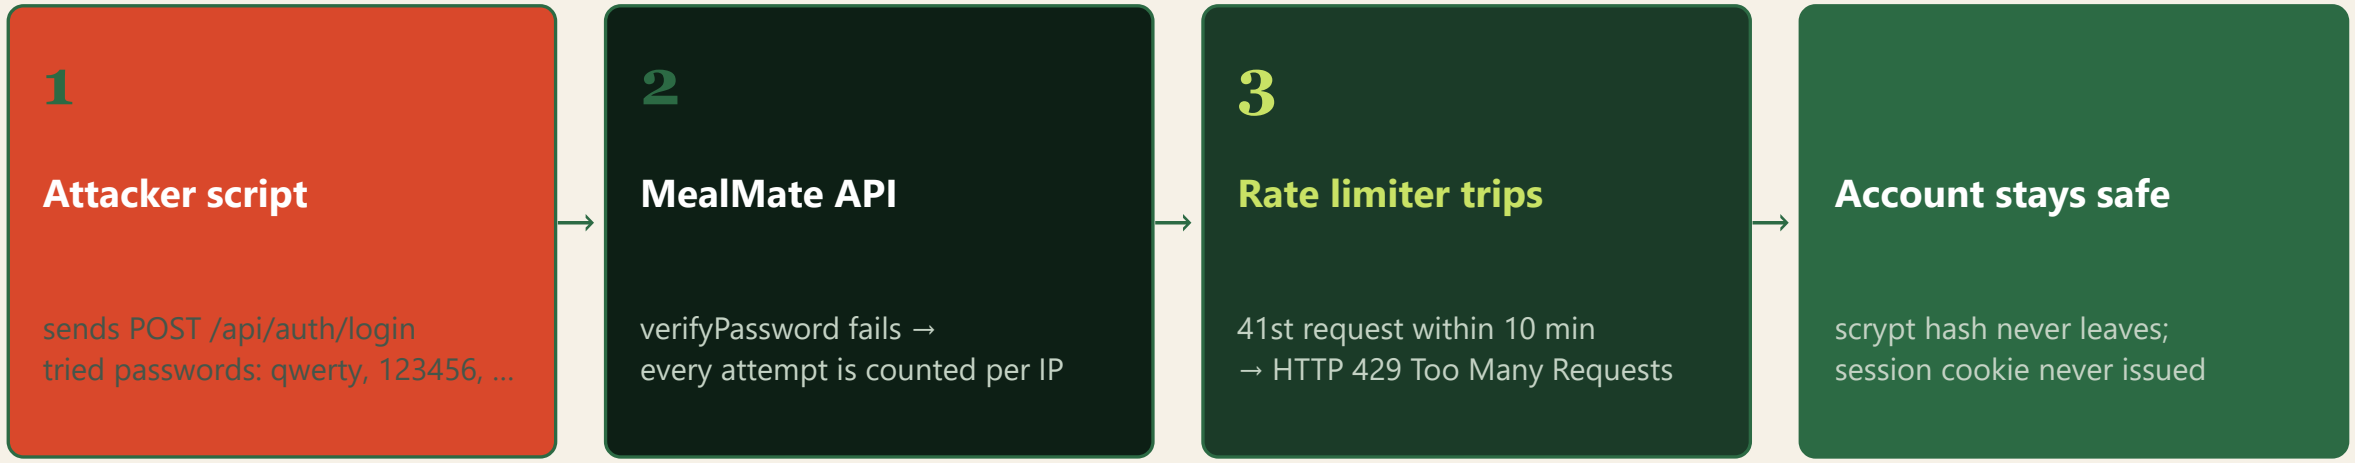

Matching query runs in SQL (two CTEs): missing = total − have per recipe, have ≥ 1 guarantees relevance — verified against the live deployment.

Five realistic risks — each closed by a measure that is actually in the code.

Risk	Consequence for users / data	Protection (implemented)
Brute-force password attacks on /login	Account takeover; personal diary exposed	Per-IP rate limit 40 req/10 min on auth; scrypt hashing makes offline cracking slow
SQL injection via search and filters	Full database dump or destruction	Parameterized queries only (node:sqlite) — zero string concatenation in SQL
XSS through diary notes and names	Script runs in other users' browsers, sessions stolen	React auto-escaping + strict server-side validation (type, length, MIME whitelist)
Session hijacking / cookie theft	Attacker acts as the victim	httpOnly + SameSite cookie, HMAC-SHA256 signature — unreadable and unforgable in JS
Oversized image uploads (DoS)	Disk and memory exhausted, service down	6 MB body limit, browser-side canvas compression to JPEG ≤ ~3 MB, MIME check

Also: security headers (helmet), one-time hashed password-reset tokens (30 min TTL), guest diary writes rejected with 401 at API level.

Threat: an attacker brute-forces the login. Watch the protection respond.

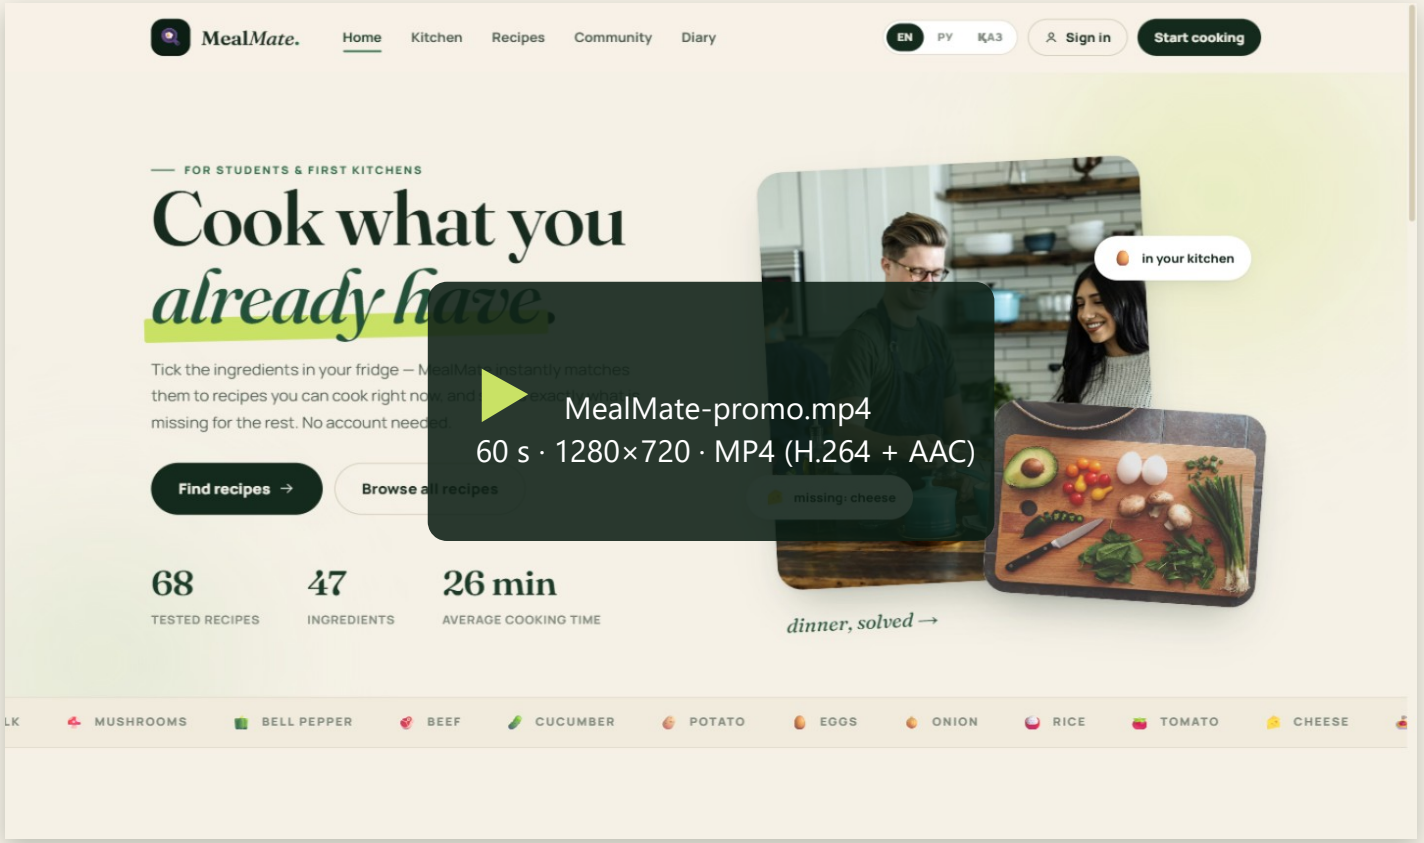

Live demo path: send 45 rapid wrong logins from the demo script → the 41st receives 429 and the rate bucket resets after 10 minutes. The same limiter protects diary uploads (20 / 10 min).

Why this scenario is safe: it runs against our own local deployment with a test account — no real third-party systems are touched.

Bonus hardening: scrypt makes each guess cost ~100 ms of CPU — brute-forcing a 8-char password becomes computationally absurd even offline.

A 60-second promo, built by the team from real product footage.

Frame from the promo — animated title over a live home-screen capture

3+ MULTIMEDIA ELEMENTS

Animation

Ken Burns zooms, fade-ups, animated underline — rendered frame by frame (1440 frames)

Text & graphics

kinetic titles, brand palette, stat captions, accent shapes

Images

real screen captures of the deployed product (home, matching, recipe, community)

Audio

original synthesized chord pad — composed in code, no stock audio

Play: *docs/MealMate-promo.mp4 (also at github.com/nafiks/mealmate → docs). Formats: H.264 video + AAC audio in MP4 — plays everywhere; PNG frames; WAV intermediate audio. Original elements: screen recordings and the synthesized soundtrack are team-created.*

INDIVIDUAL DEFENSE MAP

Every member owns a layer — ask us anything.

Artur — Lead	problem → solution reasoning, user research, feature priorities
Arsen — Frontend	design system, picker & matching UI, i18n, rendering pipeline, this deck
Adilet — Database	ER model, SQL matching CTEs, integrity, coverage audit
Sanzhar — Backend	Express API, auth & security, seed content, deployment
